MANTA BOMBER

SKILL LEVEL 3 - Recommended for Craftsman Rocketeers

RECOMMENDED ENGINES:
A8-3, B4-4, B6-4, C5-3, C6-3
(First Flight A8-3)

BEFORE YOU START

Read each step and study the accompanying drawings before doing any of the work called for in that step. Make sure you have all parts and materials. Check off each step as you complete it. Always test-fit parts together before applying glue. It will sometimes be necessary to sand edges of rings, tubes, etc. to obtain proper fit. If you are in doubt about the relative size or location of some parts, refer back to this exploded view drawing for clarification. Adequate glue joints are very important for a flying model rocket. Follow the instructions carefully in this respect.

TOOLS AND MATERIALS

In addition to the parts included in this kit you will need: Scissors, tweezers, pencil, ruler, fine or extra-fine grit sandpaper, sanding sealer, a medium-size modeling paintbrush, masking tape, modeling knife with sharp blade, gloss white enamel spray paint, and household white glue or resin glue (Elmer’s, Titebond, or similar). Other types of glue are not recommended.

Be sure to follow the HIAA-NAR® Model Rocket Safety Code when carrying out your model rocket activities.
*HIAA—Hobby Industry of America
*NAR—National Association of Rocketry
SECTION 1 - POD ASSEMBLIES

Cut out the BT-5 marking guide from page 5 of these instructions. Wrap the guide around one of the 6" long BT-5P body tubes (part A) and tape the ends together. Mark the tube at each of the arrow points. Remove the guide. Using the edge of a door frame as a guide, draw lines connecting the marks. Extend 3 lines about 2" from the end of the tube. Draw the fourth line the entire length of the tube. Repeat with the other BT-5P tube.

Fin lines

Glue ring in place

Applying glue reinforcements smooth with finger

Support while glue dries

Apply a bead of glue to the root edge of a fin. Allow the glue to set for a minute then attach it to a pod, rear edges of tube and fin even and fin centered on a pencil line. Make sure the fin projects straight from the body tube. Support the assembly with the fin pointing straight up and allow glue to dry. Attach the remaining fins in the same manner, allowing glue to dry each time. Repeat process with the remaining pod. Run a bead of glue along both sides of a fin-body joint. Pull your finger along the joint to smooth out and remove excess glue. Repeat with all remaining joints. Support the pods as before while the glue dries.

Parts required in this step are the 2 BT-5P body tubes, 2-1/2" long BT-20AE tubes (part B), 3 AR-520 centering rings (part C) and the 2-3/4" long BT-20J engine mount tube (part D). The BT-20J tube and one of the centering rings are used only as assembly aids in this step. Do not apply any glue to them. Glue a centering ring onto the front of a BT-5P tube (the fin lines are at the rear of the tube). Slide a centering ring onto the rear of the tube and slip the BT-20J tube over this ring (do not glue). Apply a bead of glue to the inside of one end of a BT-20AE tube and slide it onto the front centering ring. The rear of the tube and ring should be even. Roll the assembly back and forth on a flat surface. This will insure that the BT-20AE and the BT-5P tubes are square and parallel. Remove the BT-20J tube and ring from the rear of the assembly. Make a second assembly in the same manner. After completion, lay the BT-20J tube aside. It will be used later. The AR-520 ring may be discarded.

Do not proceed with this step until the glue reinforcements are completely dry. Apply a coat of sanding sealer to each fin. Let dry and sand with fine sandpaper. Repeat the sealing and sanding process until the grain is filled and the balsa looks and feels smooth.

Test fit a JT-80C ring (part F) onto the fins of one pod. If the fit is too tight, it will cause the ring to distort and be "out of round". If this happens, sand the outside edges of the 4 fins until the ring fits correctly. Position the ring on the fins and use a small stick to apply glue to the fin-ring joints. Repeat the process with the other pod.
SECTION 2 - MAIN BODY ASSEMBLY

Mark the engine mount tube (part D) at 1" and 2-1/2" from one end. Cut a 1/8" long slit at the 2-1/2" mark. Gently bend the engine hook (part G) so that it bows upward very slightly in the middle. (Study the drawing—Don’t bend the wrong way.) Insert one end of the engine hook into the slit in the tube.

Sand the inside edges of the two AR-2050 centering rings (part H) to remove burrs. The rings should slide easily onto the engine mount tube. Cut a very shallow 1/8" wide slot inside one centering ring so it will fit over the engine hook. Slip the ring onto the front end of the engine mount tube and slide it down to the 1" mark. Make sure the engine hook runs straight down the tube, then apply glue to both sides of this ring. Apply glue around the front end of the engine mount tube and slide the remaining centering ring into place (front of ring even with the end of the tube).

Use a small stick to apply a generous band of glue about 1-1/4" inside one end of the BT-50FE body tube (part I). Making sure the engine hook extends to the rear, slide the engine mount into the body tube. Without pauseing, slide the engine mount forward until the rear ring is even with the rear of the body tube.

Cut the wing alignment guide from the back of the kit panel (part J). Apply glue to the root edge of a wing and attach it to the body. Use the guide to check wing-rudder alignment. Support the model with the wing pointing straight up. Re-check the alignment after a few minutes and make corrections if necessary. Leave the model undisturbed until the glue is completely dry. Attach the remaining wing in the same manner.
Glue the launch lug (part K) to the launch lug stand-off. As previously described, apply glue reinforcements to all joints. Support the model in a horizontal position until the glue dries.

Cut the wood dowel (part L) into four 3" lengths (only 3 pieces will be used). Locate the 2 balsa blocks (from fin sheet). Glue 2 dowels to them as shown. Glue the third dowel to the top of the rudder. Smooth a film of glue over the joints with your finger. The 2 dowel-balsa block assemblies are glued into the front of the pods as shown. Use tweezers to position the blocks inside the tubes. Adjust the dowels so they extend straight from the pods. When the glue has dried, apply glue reinforcements to the joints with a toothpick or small stick. Seal and sand the rudder and wings as described in step 5.

Trim or sand any excess plastic from around the sides of the nose cone (part M). Use a sharp knife to remove any excess plastic from the inside of the molded eyelet at the rear of the nose cone. Wash the nose cone with lukewarm soapy water, rinse well, and dry.

NOTE: Nose cone should separate easily from rocket body tube, but should not be extremely loose. If fit is too tight, sand inside of body tube and shoulder of nose cone with fine sandpaper. If fit is too loose, add a wrapping of transparent tape to the shoulder of the nose cone.

Cut out the shock cord mount from page 5 of the instructions. Fold on dotted lines, then unfold and apply glue to Section 1. Lay the end of the shock cord (part N) into the glue. Fold over and apply glue to the back of Section 1 and the exposed portion of Section 2. Fold again to complete mount. Curl the edges of the mount up so it will match the contour of the body tube and hold with your fingers until the glue sets.
Use a finger or stick to apply glue to the inside of the front of the body tube, 1" to 2" from the front of the tube. Press the shock cord mount firmly into position in glue far enough from the front edge of the tube to allow clearance for the nose cone to fit into place. To insure a good bond use a stick or your finger to smear a film of glue over the mount and surrounding area in the body tube.

When all paint is dry, apply the decals (part R) in the positions shown. (A) Cut only one decal at a time from sheet. (B) Submerge decal in lukewarm water until decal slides on backing paper (usually 15 to 30 seconds). (C) Gently slide decal from backing paper onto model. (D) Move decal into exact position and carefully blot away excess water with a soft cloth. (E) If the decal "sticks" before you have it in position, apply water over the decal with a brush. This will permit the decal to be moved. (F) Smooth out all wrinkles and air bubbles before the decal dries. Refer to the photograph for decal positions. There are two large decals that wrap completely around the tail rings. Before applying these decals, wet the surface of the rings. This will make it easier to move these decals into position.

LAUNCHING COMPONENTS
To launch your rocket you will need the following items:
—An Estes model rocket launching system
—Flame resistant recovery wadding (Estes Cat. No. 2274)
—Estes A8-3 B4-4, B6-4, C5-3, or C6-3 model rocket engines. Use an A8-3 engine for your first flight.

Paint the entire model gloss white. Follow instructions on the spray can for best results. We recommend spray enamel. Do not paint the model with lacquer paint. Shake can before spraying. Hold the can straight up and spray in long, smooth "strokes". Spray the model with several light, dry mist coats of paint to avoid "runs". Shake can periodically. To obtain a gloss, final coat should be applied slightly heavier. Let this coat dry overnight. Be sure paint is completely dry before applying decals.
Pack 3 or 4 squares of loosely crumpled recovery wadding into the body tube.

Hold the parachute at its center and pass the other hand down it to form a "spike" shape. Fold this spike in half. Fold shroud lines back along parachute and then back down to lower edge of parachute to reduce length of shroud line "left over". Roll parachute into tube shape to fit easily into body. Any remaining shroud line should be loosely wrapped around parachute. Pack chute into the body tube on top of the wadding. Pack the shroud lines and shock cord in on top of the parachute and slip the nose cone into place.

NOTE: DO NOT pack parachute until you are actually ready to launch. For maximum parachute reliability, lightly dust the chute with ordinary talcum powder before each flight, especially in cold weather.

Select an engine and install an igniter as directed in the engine instructions. The engines recommended for use with this rocket are the A8-3, B4-4, B6-4, C5-3, and C6-3. Use an A8-3 for your first flight.

Insert engine into rocket engine mount. Engine hook must latch securely over end of the engine.

Disarm the launch panel—REMOVE SAFETY KEY!

Slide the launch rod through rocket launch lug and place rocket on launch pad. Make sure the rocket slides freely on the launch rod. Clean the micro-clips and attach them to the igniter wires. Arrange the clips so they do not touch each other or the metal blast deflector. Attach clips as close to protective tape on igniter as possible.

Clear the launch area. Alert recovery crew and trackers. Check for low flying aircraft and unauthorized persons in the recovery area.

Arm the launch panel—INSERT SAFETY KEY!

Repeat Countdown Checklist for each flight.

MISFIRE PROCEDURE

Disarm the launch panel. Wait one minute before approaching the rocket on the launch pad. Remove the rocket, clean the igniter residue from the nozzle of the engine, and carefully install a new igniter. Repeat the Countdown Checklist.

Failure of the rocket engine to function properly is nearly always caused by a failure to install the igniter correctly. This failure permits the igniter to heat and burn into two pieces without igniting the engine.
1. CONSTRUCTION — Your model rockets will be made of lightweight materials such as paper, wood, plastic and rubber, without any metal as structural parts.

2. ENGINES — I will use only preloaded factory made NAR safety certified model rocket engines in the manner recommended by the manufacturer. I will not change in any way nor attempt to reload these engines.

3. RECOVERY — I will always use a recovery system in my model rockets that will return them safely to the ground so that they may be flown again.

4. WEIGHT LIMITS — My model rocket will weigh no more than 453 grams (16 ozs.) as cast and the engines will contain no more than 113 grams (4 ozs.) of propellant.

5. STABILITY — I will check the stability of my model rockets before their first flight, except when launching models of already proven stability.

6. LAUNCHING SYSTEM — The system I use to launch my model rockets must be remotely controlled and electrically operated, and will contain a switch that will return to off when released. I will remain at least 10 feet away from any rocket that is being launched.

7. LAUNCH SAFETY — I will not let anyone approach a model rocket on a launcher until I have made sure that the safety interlock switch has been released or the battery has been disconnected from my launch system.

8. FLYING CONDITIONS — I will not launch my model rocket in high winds near buildings, power lines, tall trees, low flying aircraft, or under any conditions which might be dangerous to people or property.

9. LAUNCH AREA — My model rockets will always be launched from a cleared area, free of any trees or buildings, and I will only use fire resistant recovery materials in my rockets.

10. JET DEFLECTOR — My launcher will have a jet deflector device to prevent the engine exhaust from hitting the ground directly.

11. LAUNCH ROD — To prevent accidental eye injury I will always place the launch rod so the end of the rod is above eye level or cap the end of the rod with my hand when approaching it. I will never place my head or body over the launching rod. When my launcher is not in use I will always store it so that the launch rod is not in an upright position.

12. POWER LINES — I will never attempt to recover my rocket from a power line or other dangerous place.

13. LAUNCH TARGETS & ANGLES — I will not launch rockets so their flight path will carry them against targets on the ground, and will never use an explosive warhead or a payload that is intended to be flamable. My launching device will always be pointed within 30 degrees of vertical.

14. PRE-LAUNCH TEST — When conducting research activities with unproven designs or methods, I will when possible determine their reliability through multiple launches. I will conduct launching of unproven designs in complete isolation from persons not participating in the actual launching.

As a member of the Estes Model Rocketry Program, I promise to faithfully follow all rules of safe conduct as established in the above code.

Signed (Keep This Code in your Range Box.)

CAUTION: WARNING: for your safety DO NOT alter, dismantle, or Unwrap model rocket engines or their ingredients in any way. Soak unwanted engines in water to destroy.

FULL ONE YEAR WARRANTY

Your Estes product is warranted against defects in materials or workmanship for one year from the date of the original purchase. Any Estes product which, because of a manufacturing mistake, malfunction, or proves to be defective within the one-year warranty period will be repaired or replaced, at Estes' option and at no charge to you, provided it is returned to Estes with proof of purchase.

This warranty does not cover incidental or consequential damage including injury or damage to persons or property caused by the use, abuse, misuse, failure to comply with operating instructions or improper storage of the warranted product. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above exclusion may not apply to you.

This warranty gives you specific legal rights and you may also have other rights which vary from state to state. For repair or replacement under this warranty, please return the defective part of your Estes product with proof of purchase to: Estes Industries, Customer Service Department, Penrose, Colorado 81240.
